### ***Reasons For Allowance***

The invention in this case is directed to a gas turbine or boiler that burns gaseous fuel and comprises, among other things, a condensate detector for determining the condensate content of the fuel. The presence of condensate in fuel gas is a recognized problem, and existing gas fuel systems typically remove any condensation and then heat the fuel gas above its dew point; i.e. superheat it, to prevent further condensation. Such a system is shown, for example, by the Tiras Patent cited on PTO-892. The system disclosed by Tiras comprises liquid removal device 20 followed by elements 30 and 40 for monitoring fuel gas dew point and heating the gas above that point. The dew point however is not a measure of condensation, and neither Tiras nor any of the other references of record disclose or fairly suggest a fuel gas supply system combined with a detector that actually determines condensate content in a gaseous fuel. The present invention is therefore considered to be patentable.
